

## ABSTRACT

A curling iron is provided including a first leg with a bottom surface and a second leg with a top surface, the bottom and top surfaces being in opposed relationship to each other and having a nested convex/concave shape. In the preferred embodiment, both of the legs are heated. Also, in one embodiment, the first leg is biased against a second leg, and a release lever is provided for selectively overcoming the biasing force and separating said legs. In another embodiment, the first leg is pivotable relative to the second leg, and a clamp lever is provided for controlling the pivoting action.
